Education

Alma Mater Studiorum — Università di Bologna, Bologna (Italy)

Dottorato (Ph.D.) in Mathematics.   **January 2009 – May 2012**
- Defense: June 8, 2012
- Dissertation: Classical limit of the Nelson model
- Advisor: Prof. Giorgio Velo
- Committee: Prof. Piero D'Ancona, Prof. Alberto Parmeggiani, Prof. Marco Peloso

Laurea Specialistica (M.Sc.), Theoretical Physics   **2005 – 2007**
- Grade: 110/110 *cum Laude*
- Dissertation: On the regularization of phase-space path integral in curved manifolds
- Advisor: Prof. Fiorenzo Bastianelli

Laurea Triennale (B.Sc.), Physics   **2002 – 2005**
- Grade: 110/110 *cum Laude*
- Dissertation: Sulla nozione di distinguibilità e degenerazione (in Italian)
- Advisor: Prof. Loris Ferrari

Teaching Experience	**Politecnico di Milano**

Publications *Quasi-Classical Dynamics* (with M. Correggi, M. Olivieri)
J. Eur. Mat. Soc., to appear (2022)
⊠1909.13313

Abstract: We study quantum particles in interaction with a force-carrying field, in the quasi-classical limit. This limit is characterized by the field having a very large number of excitations (it is therefore macroscopic), while the particles retain their quantum nature. We prove that the interacting microscopic dynamics converges, in the quasi-classical limit, to an effective dynamics where the field acts as a classical environment that drives the quantum particles.

Microscopic derivation of time-dependent point interactions (with R. Carlone, M. Correggi, M. Olivieri)   **SIAM J. Math. Anal. 53(4), 4657-4691 (2021)**
⊠1904.11012

Abstract: We study the dynamics of the three-dimensional Fröhlich polaron – a quantum particle coupled to a bosonic field – in the quasi-classical regime, *i.e.*, when the field is very intense and the corresponding degrees of freedom can be treated semiclassically. We prove that in such a regime the effective dynamics for the quantum particles is approximated by the one generated by a time-dependent point interaction, *i.e.*, a singular time-dependent perturbation of the Laplacian supported in a point. As a byproduct, we also show that the unitary dynamics of a time-dependent point interaction can be

approximated in strong operator topology by the one generated by time-dependent Schrödinger operators with suitably rescaled regular potentials.

The dilute Fermi gas via Bogoliubov theory (with E.L. Giacomelli, C. Hainzl, M. Porta) **Ann. Henri Poincaré 22(7), 2283-2353 (2021)**
2006.00491

Abstract: We study the ground state properties of interacting Fermi gases in the dilute regime, in three dimensions. We compute the ground state energy of the system, for positive interaction potentials. We recover a well-known expression for the ground state energy at second order in the particle density, which depends on the interaction potential only via its scattering length. The first proof of this result has been given by Lieb, Seiringer and Solovej. In this paper we give a new derivation of this formula, using a different method; it is inspired by Bogoliubov theory, and it makes use of the almost-bosonic nature of the low-energy excitations of the systems. With respect to previous work, our result applies to a more regular class of interaction potentials, but it comes with improved error estimates on the ground state energy asymptotics in the density.

Some rigorous aspects of fragmented condensation (with D. Dimonte, A. Olgiati)
Nonlinearity 34(1), 1-32 (2021)
1809.03586
10.1088/1361-6544/abb451

Abstract: In this paper we discuss some aspects of fragmented condensation from a mathematical perspective. Inspired by techniques of pseudodifferential calculus and semiclassical analysis in Bosonic Quantum Field Theory, we propose a simple way of identifying fragmentation, and we analyze the effects of pair interaction on finite fragmented states. In particular, we focus on the persistence of finite fragmented condensation when the gap between the degenerate ground state and the excited states of the corresponding non-interacting system is very large.

Ground State Properties in the Quasi-Classical Regime (with M. Correggi, M. Olivieri) **Preprint (2020)**
2020.09442

Abstract: We study the ground state energy and ground states of systems coupling non- relativistic quantum particles and force-carrying Bose fields, such as radiation, in the quasi-classical approx- imation. The latter is very useful whenever the force-carrying field has a very large number of excitations, and thus behaves in a semiclassical way, while the non-relativistic particles, on the other hand, retain their microscopic features. We prove that the ground state energy of the fully microscopic model converges to the one of a nonlinear quasi-classical functional depending on both the particles' wave function and the classical configuration of the field. Equivalently, this energy can be interpreted as the lowest energy of a Pekar-like functional with an effective nonlinear interaction for the particles only. If the particles are confined, the ground state of the microscopic system converges as well, to a probability measure concentrated on the set of minimizers of the quasi-classical energy.

Magnetic Schrödinger Operators as the Quasi-Classical Limit of Pauli-Fierz-type Models (with M. Correggi, M. Olivieri) **J. Spectr. Theory 9(4), 1287-1325 (2019)**
1711.07413
10.4171/JST/277

Abstract: We study the quasi-classical limit of the Pauli-Fierz model: the system is composed of finitely many non-relativistic charged particles interacting with a bosonic radiation field. We trace out the degrees of freedom of the field, and consider the classical limit of the latter. We prove that the partial trace of the full Hamiltonian converges, in resolvent sense, to an effective Schrödinger operator with magnetic field and a corrective electric potential that depends on the field configuration. Furthermore, we prove the convergence of the ground state energy of the microscopic system to the infimum over all possible classical field configurations of the ground state energy of the effective Schrödinger operator.

Cylindrical Wigner measures **Doc. Math. 23, 1677-1756 (2018)**
1605.04778
10.25537/dm.2018v23.1677-1756

Abstract: In this paper we study the semiclassical behavior of quantum states acting on the C*-algebra of canonical commutation relations, from a general perspective. The aim is to provide a unified and flexible approach to the semiclassical analysis of bosonic systems. We also give a detailed overview

of possible applications of this approach to mathematical problems of both axiomatic relativistic quantum field theories and nonrelativistic many body systems. If the theory has infinitely many degrees of freedom, the set of Wigner measures, *i.e.* the classical counterpart of the set of quantum states, coincides with the set of all cylindrical measures acting on the algebraic dual of the space of test functions for the field, and this reveals a very rich semiclassical structure compared to the finite-dimensional case. We characterize the cylindrical Wigner measures and the *a priori* properties they inherit from the corresponding quantum states.

Concentration of cylindrical Wigner measures

Abstract: In this brief note we aim to characterize the cylindrical Wigner measures associated to regular quantum states in the Weyl C*-algebra of canonical commutation relations. In particular, we provide conditions, at the quantum level, sufficient to prove the concentration of all the corresponding cylindrical Wigner measures as Radon measures on suitable topological vector spaces. The analysis is motivated by variational and dynamical problems in the semiclassical study of bosonic quantum field theories.

Effective Potentials Generated by Field Interaction in the Quasi-Classical Limit

(with M. Correggi)

Abstract: In this work we study the partial dynamics of particles linearly coupled with a quantized radiation field, in the *quasi-classical limit*. We prove that, as the field alone becomes macroscopic and the corresponding degrees of freedom are traced out, the effective Hamiltonian of the particles converges in resolvent sense to a self-adjoint Schrödinger operator that contains an additional external potential induced by the field configuration. The explicit form of such potential can be described exactly using techniques from semiclassical analysis. For specific (coherent) field configurations, it is possible to obtain trapping potentials. Finally, we prove convergence of the ground state energy of the full system to a suitable effective variational problem involving the classical state of the field: the original ground state energy converges to the infimum of the ground state energy of the quasi-classical Hamiltonian of the particles, over all (classical) field configurations with finite energy.

Scattering theory for Lindblad master equations (with J. Faupin, J. Fröhlich, B. Schubnel)

Abstract: In this work we study the scattering theory for evolution semigroups of Lindblad type, on the ideal $I_1(\mathcal{H})$ of trace class operators on a Hilbert space $\mathcal{H}$. The semigroups of Lindblad type are C_0-semigroups that map the convex cone $I_1(\mathcal{H})_+ \subset I_1(\mathcal{H})$ of positive elements into itself, preserving the trace. They are used to describe open quantum systems in the Markovian regime. We discuss the regularity assumptions on the non unitary part of the semigroup generator, sufficient to prove existence of the wave operators and the asymptotic completeness of the theory. We also introduce the modified wave operators useful to describe physical systems in which particles can be captured by the target during the scattering process. An important ingredient in our analysis is the scattering theory for dissipative operators in Hilbert spaces.

Bohr's correspondence principle for the renormalized Nelson model (with Z. Ammari)

Abstract: Egorov-type theorems characterize the evolution of semiclassical Wigner measures corresponding to quantum states that are evolved by means of a unitary dynamics. To the quantum linear evolution there corresponds, in the semiclassical limit, the pushforward of the Wigner measure by means of the (nonlinear) classical Hamiltonian flow associated to the system. For quantum field theories, proving such type of results provides some serious technical challenges, due to the necessity of performing, at the quantum level, renormalization procedures in order to define the dynamics non-perturbatively. In addition, these procedures may in principle modify the classical dynamics that is obtained in the limit. In this work we prove an Egorov-type theorem for an important model of nonrelativistic quantum field theory widely used in condensed matter physics: the Nelson model. We make crucial use of a

family of symplectomorphisms in the classical phase space, that allow to put the classical system of Schrödinger-Klein-Gordon equations in a "normal form" suitable for quantization, providing at the same time a bridge between the undressed and dressed dynamics of the system.

On the rate of convergence for the mean field approximation of Bosonic many-body quantum dynamics (with Z. Ammari, B. Pawilowski)

Abstract: In recent years, the derivation of effective mean field dynamical theories from underlying microscopic theories has been a subject of great interest for both the communities of mathematical physics and analysis. In this work, we study the time propagation of the rate of convergence for the reduced density matrices corresponding to generic states in bosonic non-relativistic systems. We prove that the initial-time rate of convergence is preserved by the evolution of the system if it is at most of order $1/n$ (where n is the number of particles in the system). For initial rates of order $o(1/n)$, the time evolution reduces the rate to order $1/n$. This result holds, provided the interaction potential between particles is sufficiently regular, for a very wide class of initial microscopic configurations, and shows that the initial coherent structure *is not a priori necessary* to obtain an optimal rate of convergence. We also verify through numerical analysis that $O(1/n)$ is indeed the optimal rate of convergence, both for initial microscopic states with coherent structure ("mean-field states") and for a class of more entangled states ("twin Fock states").

Self-Adjointness criterion for operators in Fock spaces

Abstract: In this work we discuss a self-adjointness criterion for densely defined symmetric operators in Fock spaces. The criterion applies to polynomials in the creation and annihilation operators, whose "non-diagonal" part (the part with a different number of creation and annihilation operators) is at most of order two. The advantage of this method is that it does not require neither positivity of the operator, nor that one part of it is a small perturbation of the other. Therefore it can be applied also in situations where the aforementioned conditions are not satisfied. Some applications are discussed; of particular interest is the one to Pauli-Fierz type operators.

Wigner measures approach to the classical limit of the Nelson model: Convergence of dynamics and ground state energy (with Z. Ammari)

Abstract: In this work we derive a Schrödinger-Klein-Gordon dynamical system as the classical limit of a microscopic model of non-relativistic bosonic particles in regularized interaction with a scalar bosonic field. Microscopic states evolved in time converge to the push-forward through the S-KG flow of probability measures concentrated in the energy space (Wigner measures). In addition, the ground state energy of the microscopic model converges, when the density of non-relativistic particles is fixed, to the infimum of the S-KG energy functional.

Global Solution of the Electromagnetic Field-Particle System of Equations

Abstract: The Newton-Maxwell system describes the nonlinear coupled dynamics of charges (with extended charge distribution) in interaction with the electromagnetic field. We study the global well-posedness of the corresponding Cauchy problem, both in homogeneous Sobolev spaces with negative index, and in non-homogeneous Sobolev spaces with positive index (for the electromagnetic field). The static part of Maxwell's equations act as a constraint on the initial data, and it is satisfied at any time if satisfied at the initial time. The local well-posedness is extended to any time using energy-type estimates, assuming suitable regularity of the particles' charge distribution.

Mean field limit of bosonic systems in partially factorized states and their linear combinations

Abstract: We study the mean field limit of marginal densities in a system of non-relativistic bosons with pair interaction, corresponding to linear combinations of either coherent or (partially) factorized states. Such marginals converge, in the Hilbert-Schmidt norm, to linear combinations of projectors onto solutions of the Hartree equation corresponding to each initial condition.

Classical limit of the Nelson model with cut off

Abstract: In this work we study the classical limit of the Nelson model with cut off, in the regime where both numbers of non-relativistic particles and field excitations are infinitely large. We prove convergence of the expectation value of canonical quantum observables to the solution of the corresponding classical equations, and we characterize the two-parameter evolution group of quantum fluctuations. The expectation values are calculated with respect to coherent and factorized states both for the particles and the scalar field. The choice of factorized states for the scalar field yields a somewhat unexpected quantum residue in the classical limit. It takes the form of an average over all classical solutions corresponding to initial data that differ by a phase.

Mode Regularization for N = 1,2 SUSY Sigma Model (with R. Bonezzi)

Abstract: Worldline $N=1$ and $N=2$ supersymmetric sigma models in curved background are useful to describe spin one-half and spin one particles coupled to external gravity, respectively. It is well known that worldline path integrals in curved space require regularization: we present here the mode-regularization for these models, finding in particular the corresponding counterterms, both in the case of flat and curved indices for worldline fermions. For $N=1$, using curved indices we find a contribution to the counterterm from the fermions that cancels the contribution of the bosons, leading to a vanishing total counterterm and thus preserving the covariance and supersymmetry of the classical action. Conversely in the case of $N=2$ supersymmetries we obtain a non-covariant counterterm with both curved and flat indices. This work completes the analysis of the known regularization schemes for $N=1,2$ nonlinear sigma models in one dimension.

Proceedings *Semiclassical Analysis in Infinite Dimensions: Wigner Measures*

Abstract: We review some aspects of semiclassical analysis for systems whose phase space is of arbitrary (possibly infinite) dimension. An emphasis will be put on a general derivation of the so-called Wigner classical measures as the limit of states in a non-commutative algebra of quantum observables.

European Mathematical Society (EMS)   **2015-2020**

American Mathematical Society (AMS)   **2016-2020**

International Association of Mathematical Physics (IAMP)   **2014-2020**

Gruppo Nazionale di Fisica Matematica (GNFM)   **2017-2018, 2020**

Honors, Awards,   *Postdoc Fellowships*
Fellowships

    Twentyfour months, Universität Tübingen   **January 2018 - December 2019**
    Postdoc fellowship

    Nine months, Universität Zürich   **April - December 2017**
    Postdoc fellowship

    Twelve months, Università di Roma Tre   **April 2016 - March 2017**
    Assegno di Ricerca --- FIR project Cond-Math

    Six months, Universität Stuttgart   **October 2015 - March 2016**
    Postdoc fellowship

    Twelve months, Centre Henri Lebesgue   **October 2014 - September 2015**
    Centre Henri Lbesgue fellowship
    Programme "Investissements d'avenir" --- ANR-11-LABX-0020-01

    Nine months, Centre Henri Lebesgue   **January - September 2014**
    Centre Henri Lbesgue fellowship
    Programme "Investissements d'avenir" --- ANR-11-LABX-0020-01

Ph.D. Grant

    Three years, Università di Bologna   **2009, 2010, 2011**

Selected   *Nonlinear Dynamics in Quantum Mechanics*   **October 1st-2nd, 2020**
Conferences   Bremen, Germany (online)
Attended   Invited speaker

    XXI Congresso U.M.I.   **September 2nd-6th, 2019**
    Pavia, Italy
    Contributed speaker

    Gran Sasso Quantum Meetings GSSI: from Many Particle Systems to Quantum Fluids
    L'Aquila, Italy   **November 28th-December 1st, 2018**
    Invited speaker

    Trails in Quantum Mechanics and Surroundings 2018   **September 27th-29th, 2018**
    Torino, Italy
    Invited speaker

    AQFT: Where Operator Algebras Meet Microlocal Analysis   **June 4th-8th, 2018**
    Cortona, Italy
    Contributed speaker

    Journées mesures en dimension infinie et applications   **November 17th-18th, 2016**
    Reims, France
    Invited speaker

    Mathematical quantum field theory and related topics   **June 6th-8th, 2016**
    Fukuoka, Japan
    Invited speaker

Language skills

Italian	Mother Tongue
English	Fluent
French	Very good knowledge
Spanish	Basic knowledge
